Masonry Wall Interior Insulation Retrofit Embedded Beam Simulations

BEST3 Conference April 2-4, 2012

Introduction

- Retrofit interior insulation of masonry buildings
- Exterior insulation ideal solution
- Interstitial condensation, freeze-thaw issues
- Moisture-sensitive (wood) beams and joists embedded in masonry structure
 - Reduced heat flow
 - Higher localized relative humidity
 - Reduced drying (with low-permeance insulations)

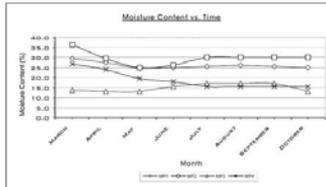

Masonry Wall Interior Insulation Retrofit Embedded Beams 2

Literature Review (DuMont et al. 2005)

- In SK (Zone 7B), joists stayed dry (10-15% MC)
- In ON (Zone 6A), at times 20%+ MC
 - Capillarity from foundation?
 - Rainwater absorption through face of masonry?

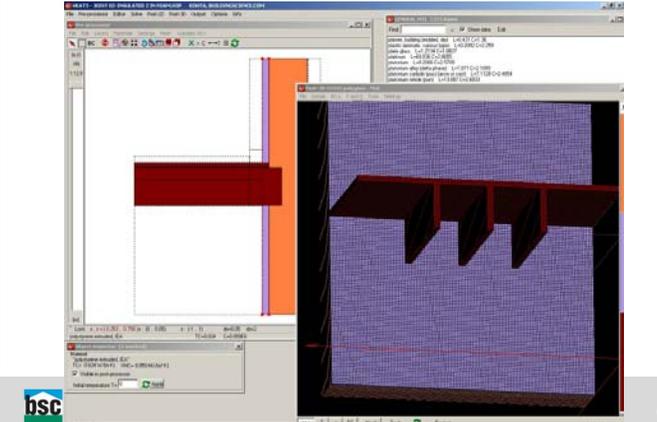

Literature Review (Con't)

- Scheffler (2009)
 - DELPHIN 2D hygrothermal simulations, steady state
 - Interior-sourced air and vapor flow risks
 - Transient simulations; beam end MCs increase w. insul.
 - Historic & modern methods to address beam end MCs
- Morelli (2010)
 - Gap in insulation above and below beam area (12" above and below → 30" left exposed)
 - 60% heat flow reduction from full insulation
 - 45% reduction with "gapped" insulation
 - "Gapped" insulation has less wetting than full insulation

HEAT 3D Three-dimensional simulations

 Building Science Corporation 6

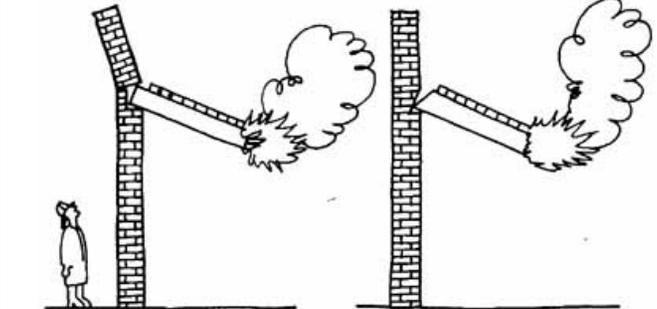

Beam Case Simulation Geometries

78" x 78" (2 m x 2 m) wall / 18" (0.45 m) thick / 12" x 8" (0.3 m x 0.2 m) beam
Insulated cases add 2" (50 mm) of closed-cell spray foam

Masonry Wall Interior Insulation Retrofit Embedded Beams 8

- ### Hygrothermal (1D) Simulations
- One dimensional section same in uninsulated and insulated cases
 - Modify wood material thermal conductivity, to result in correct beam end temperatures
 - Needed to develop a "temperature index" at end of beam pocket from HEAT3 simulations
- BSC Building Science Corporation** Masonry Wall Interior Insulation Retrofit Embedded Beams 16

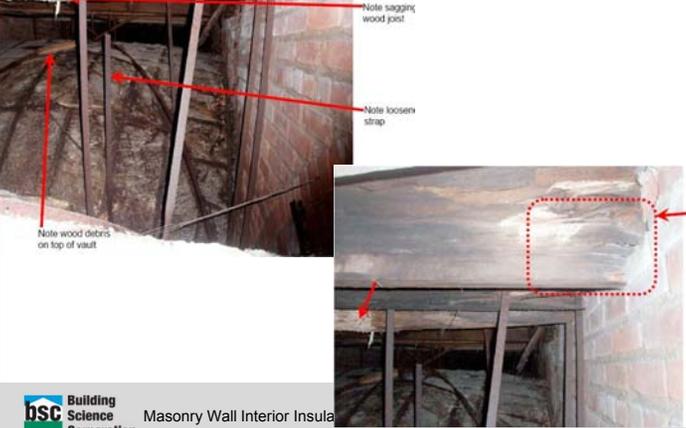

Future Work (Beam MC Monitoring)

ation 25

Beam damage w/o insulation

Note sagging wood post
Note loosen strap
Note wood debris on top of vault
